

## Analyse packet capture with Wireshark

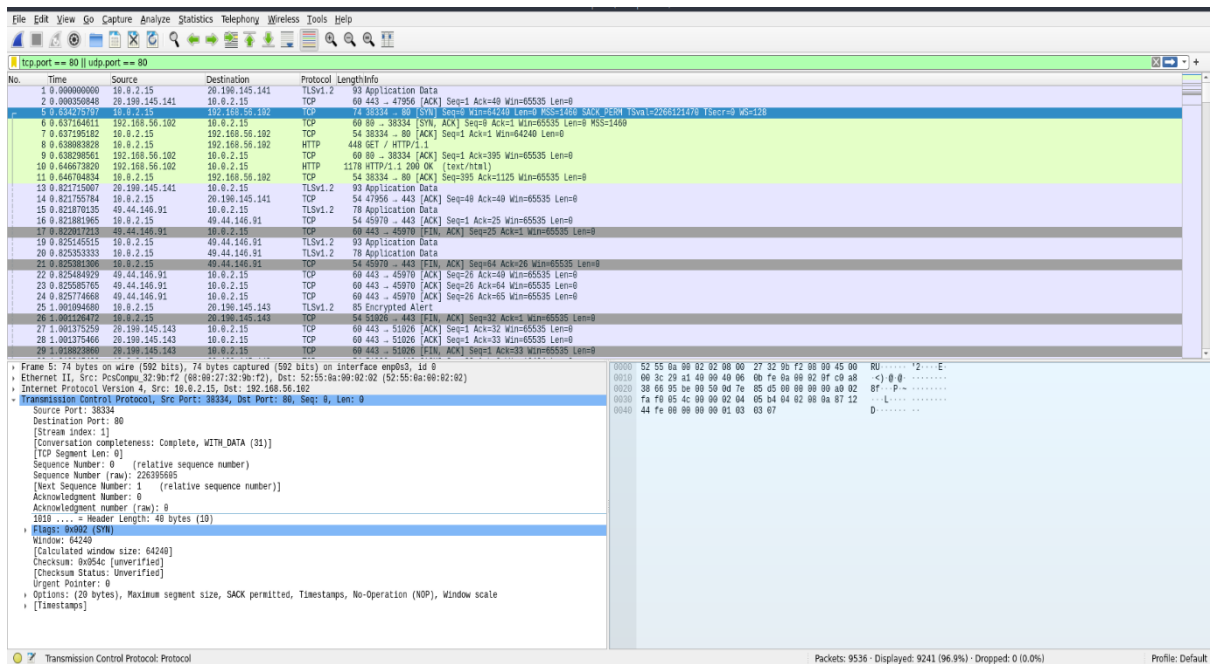

Launch Wireshark.

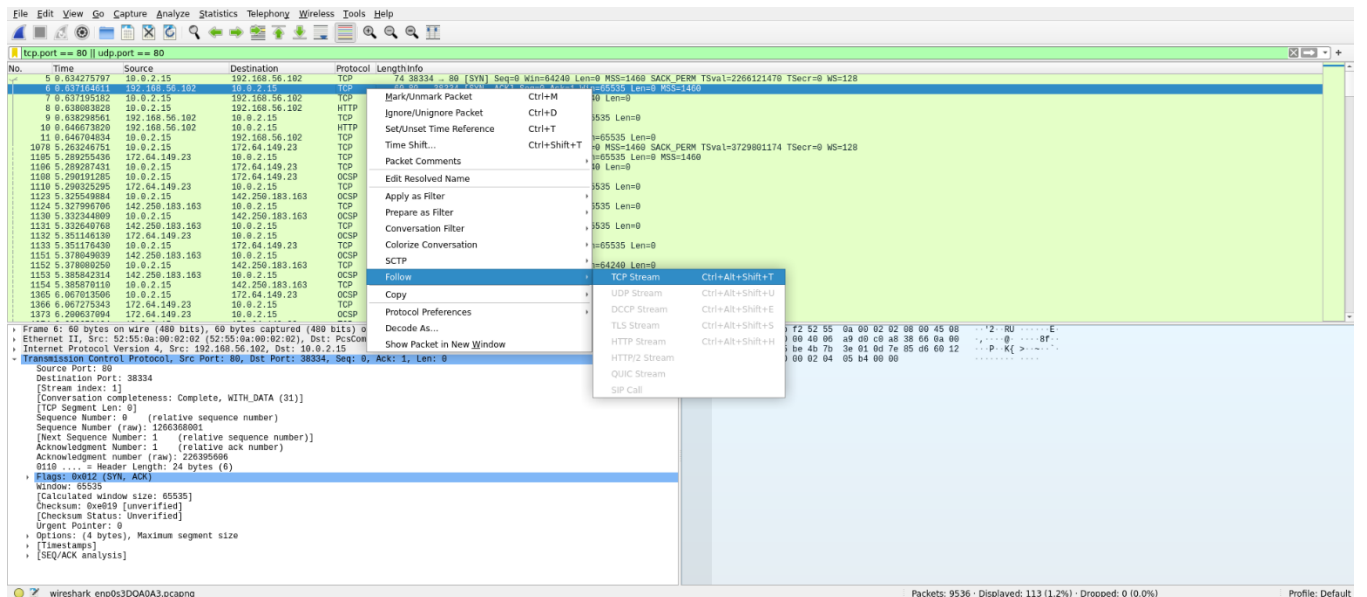

Load the .pcap

## Apply Display Filter for Ports

To focus on traffic involving specific ports: `tcp.port == 80 || udp.port == 53`

Click on packets using interesting ports and expand the **"Transmission Control Protocol"** or **"User Datagram Protocol"** section. Look for:

## Port number

## Right-click > "Follow TCP/UDP Stream"

This is helpful to:

- Reconstruct sessions.
- View protocol behavior.
- Identify services based on data patterns.
